

NEURADIX POS

Sell Anywhere. Stay in Control.

Local-first point of sale for independent shops, multi-location brands, and businesses connected to a dedicated ERPNext environment.

CLIENT REVIEW EDITION

CURRENT PRODUCT + PROPOSED LOCAL MULTI-SHOP SYNC

September 2026

Built for the counter. Ready for the road.

AVAILABLE TODAY

One Flutter experience adapts to the device and deployment model that fits the business.

Responsive workspace

Phone, tablet, and desktop layouts keep the same customer, inventory, selling, history, and profile workflows accessible across form factors.

Local-first operation

SQLite-backed workflows keep essential data close to the operator and reduce dependence on a perfect connection at the moment of sale.

A deployment that can grow

Start on one device, use shared Neuradix Cloud, or connect to a dedicated ERPNext/Frappe environment when the business needs central control.

PHONE

TABLET

WINDOWS PC

Choose the right deployment

The POS experience stays familiar while storage, synchronization, and administration match the operating model.

1

Device Local

AVAILABLE TODAY

A hosted identity with inventory, customers, and sales retained on one device. Best for an independent shop that does not require shared history.

ONE DEVICE

2

Local Multi-Shop

PROPOSED - NOT YET IMPLEMENTED

Authorized shop devices share customers and finalized sales while their catalogs and stock remain local. No permanent Neuradix business-data storage.

LOCAL REPLICAS

3

Cloud or Dedicated ERP

AVAILABLE TODAY

Use the shared Neuradix backend or a company's own Frappe/ERPNext bench for persistent, server-backed operational data.

SERVER-BACKED

AVAILABLE TODAY

A complete sale in six clear steps

The operator moves from customer context to a reviewable transaction without leaving the selling workspace.

Barcode-ready without overpromising

The current workflow accepts barcode values through the item field and compatible hardware scanners that behave as keyboard input. It does not claim camera-based scanning.

Products and customers at the counter

AVAILABLE TODAY

Fast setup and progressive search keep daily maintenance inside the same POS.

Products and inventory

- Create items with SKU, barcode, name, image, price, stock, and active status.
- Choose an item image from local device storage.
- Filter as the operator types by name, SKU, or barcode.
- Add the exact barcode or SKU match directly to the cart.
- Keep stock local or synchronize it through the selected server-backed deployment.

Customers and history

- Create customers with contact and address details.
- Search progressively by customer code, name, or phone.
- Keep the selected customer attached to the sale composer.
- Review completed sales by customer, date, status, total, and line items.
- Apply representative visibility and account policies on dedicated company benches.

AVAILABLE TODAY

Keep selling when the connection drops

Local persistence protects the selling moment; synchronization catches up when the selected backend is reachable.

Offline continuity already in the product

- Park orders on the device and return to them later.
- Cache customer, catalog, pricing, policy, image, visit-plan, and history data in dedicated mode.
- Show pending work through sync indicators and logout guards.

Local source of truth
The sale is never dependent on a perfect connection at the exact moment the customer is ready.

AVAILABLE TODAY

Dedicated business operations

A company-owned ERPNext/Frappe environment keeps central commercial rules while sales representatives work locally.

ABP: one customer relationship across five shops

The proposed model shares customer context and finalized sales without forcing every location to sell the same products.

How a sale reaches another shop

A signed event moves only while peers are online; acknowledgement follows durable local storage.

If nobody else is online

Shop A keeps the event in its local queue and retries later.
The relay is deliberately not a durable mailbox.

No permanent cloud storage for business data

Neuradix still provides identity, subscriptions, public keys, device registration, and temporary encrypted routing; business payloads remain on authorized devices.

Trust every device before it joins

A cloud login identifies the account; a trusted business device controls access to the data-encryption key.

Security with honest operational limits

- Signed events expose tampering and preserve origin attribution.
- Revocation blocks future relay access but cannot erase data already copied.
- Devices must overlap online; the relay has no durable mailbox.
- Losing every synchronized replica permanently loses the business data.

Capability matrix and client review

A concise boundary between what is available now and what the proposed local multi-shop release will add.

Capability	Device Local	Local Multi-Shop	Shared Cloud	Dedicated ERP
Local selling	Available	Proposed	Available	Available
Customer records	One device	Local replicas	Shared cloud	ERP-managed
Finalized sales	One device	Local replicas	Shared cloud	ERP-managed
Items + stock	One device	Local per shop	Shared cloud	Company catalog
Stored by Neuradix	No	No	Yes	No - client bench
Multi-device history	No	Proposed	Server-backed	Server-backed

Client review points

- Confirm that customers and finalized sales are the only replicated business records.
- Confirm that catalogs and stock remain shop-local.
- Accept overlap-online sync and replica-only recovery, or request a backup option.
- Decide commercial plan assignment and device limits later.
